

birdhouse: a collection of web processing services for climate data

Carsten Ehbrecht¹, Nils Hempelmann² et. al.

1. German Climate Computing Center, Germany

2. Le Laboratoire des Sciences du Climat et de l'Environnement, France

info[a]nilshempelmann.de

Climate Data volume grows quickly

But on client side:
Limited storage/compute capacities

**“download and
process at home”**

**Processing
in or close to
Data archives**

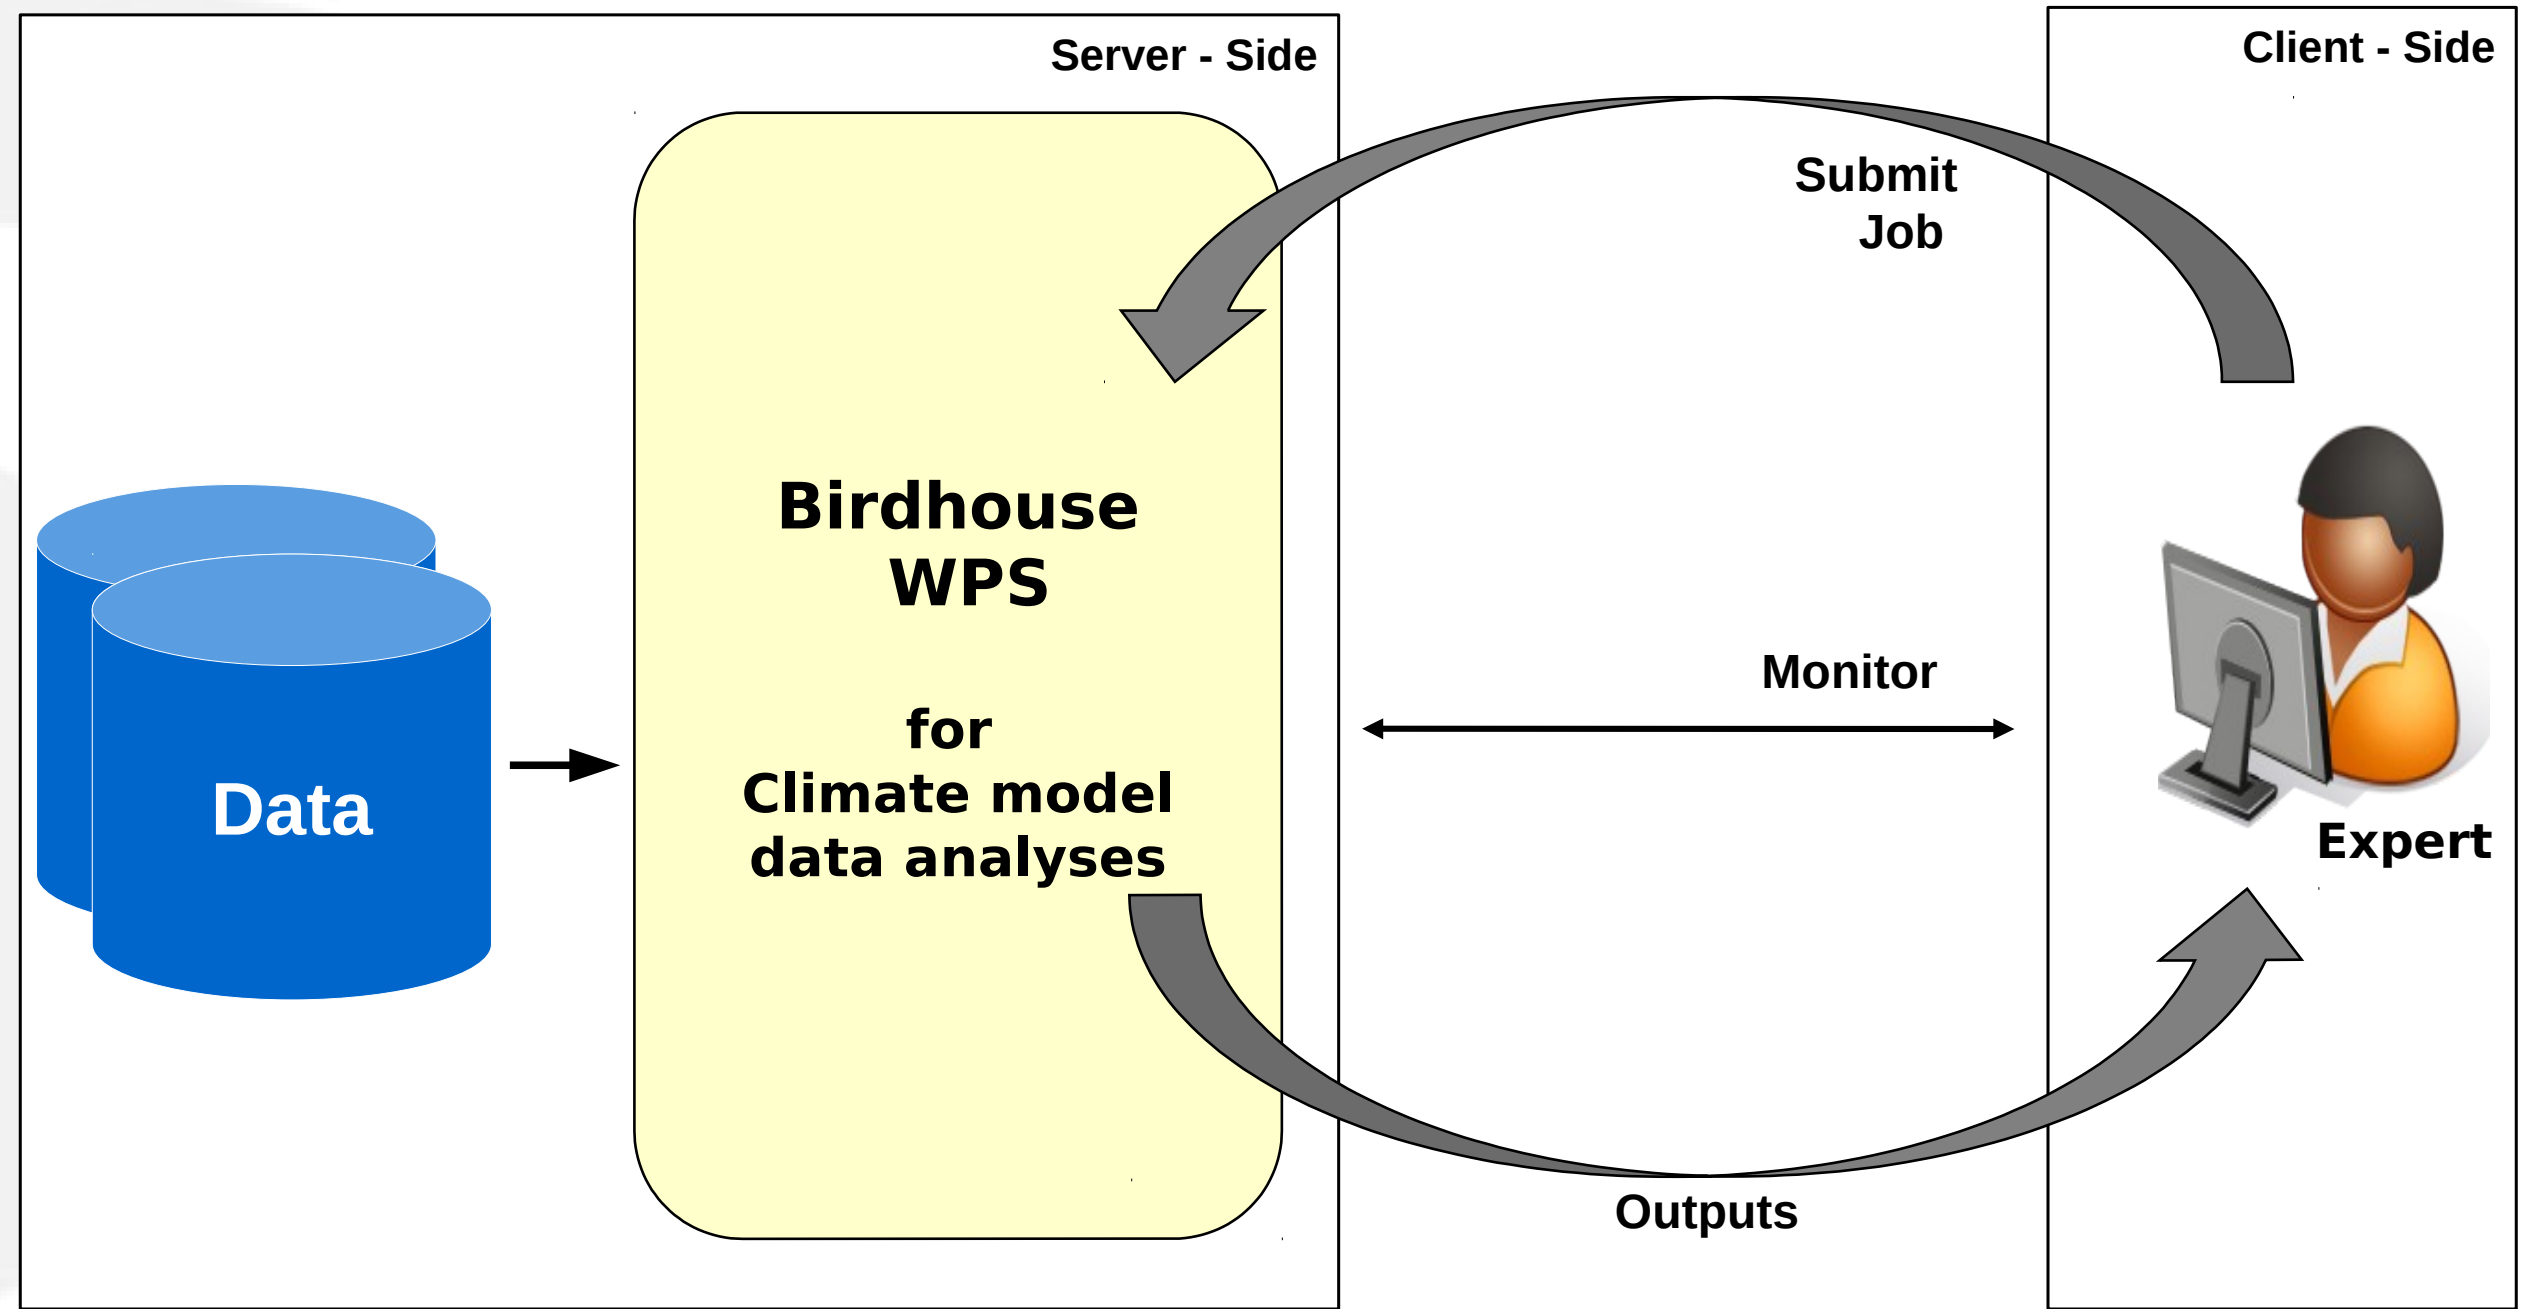

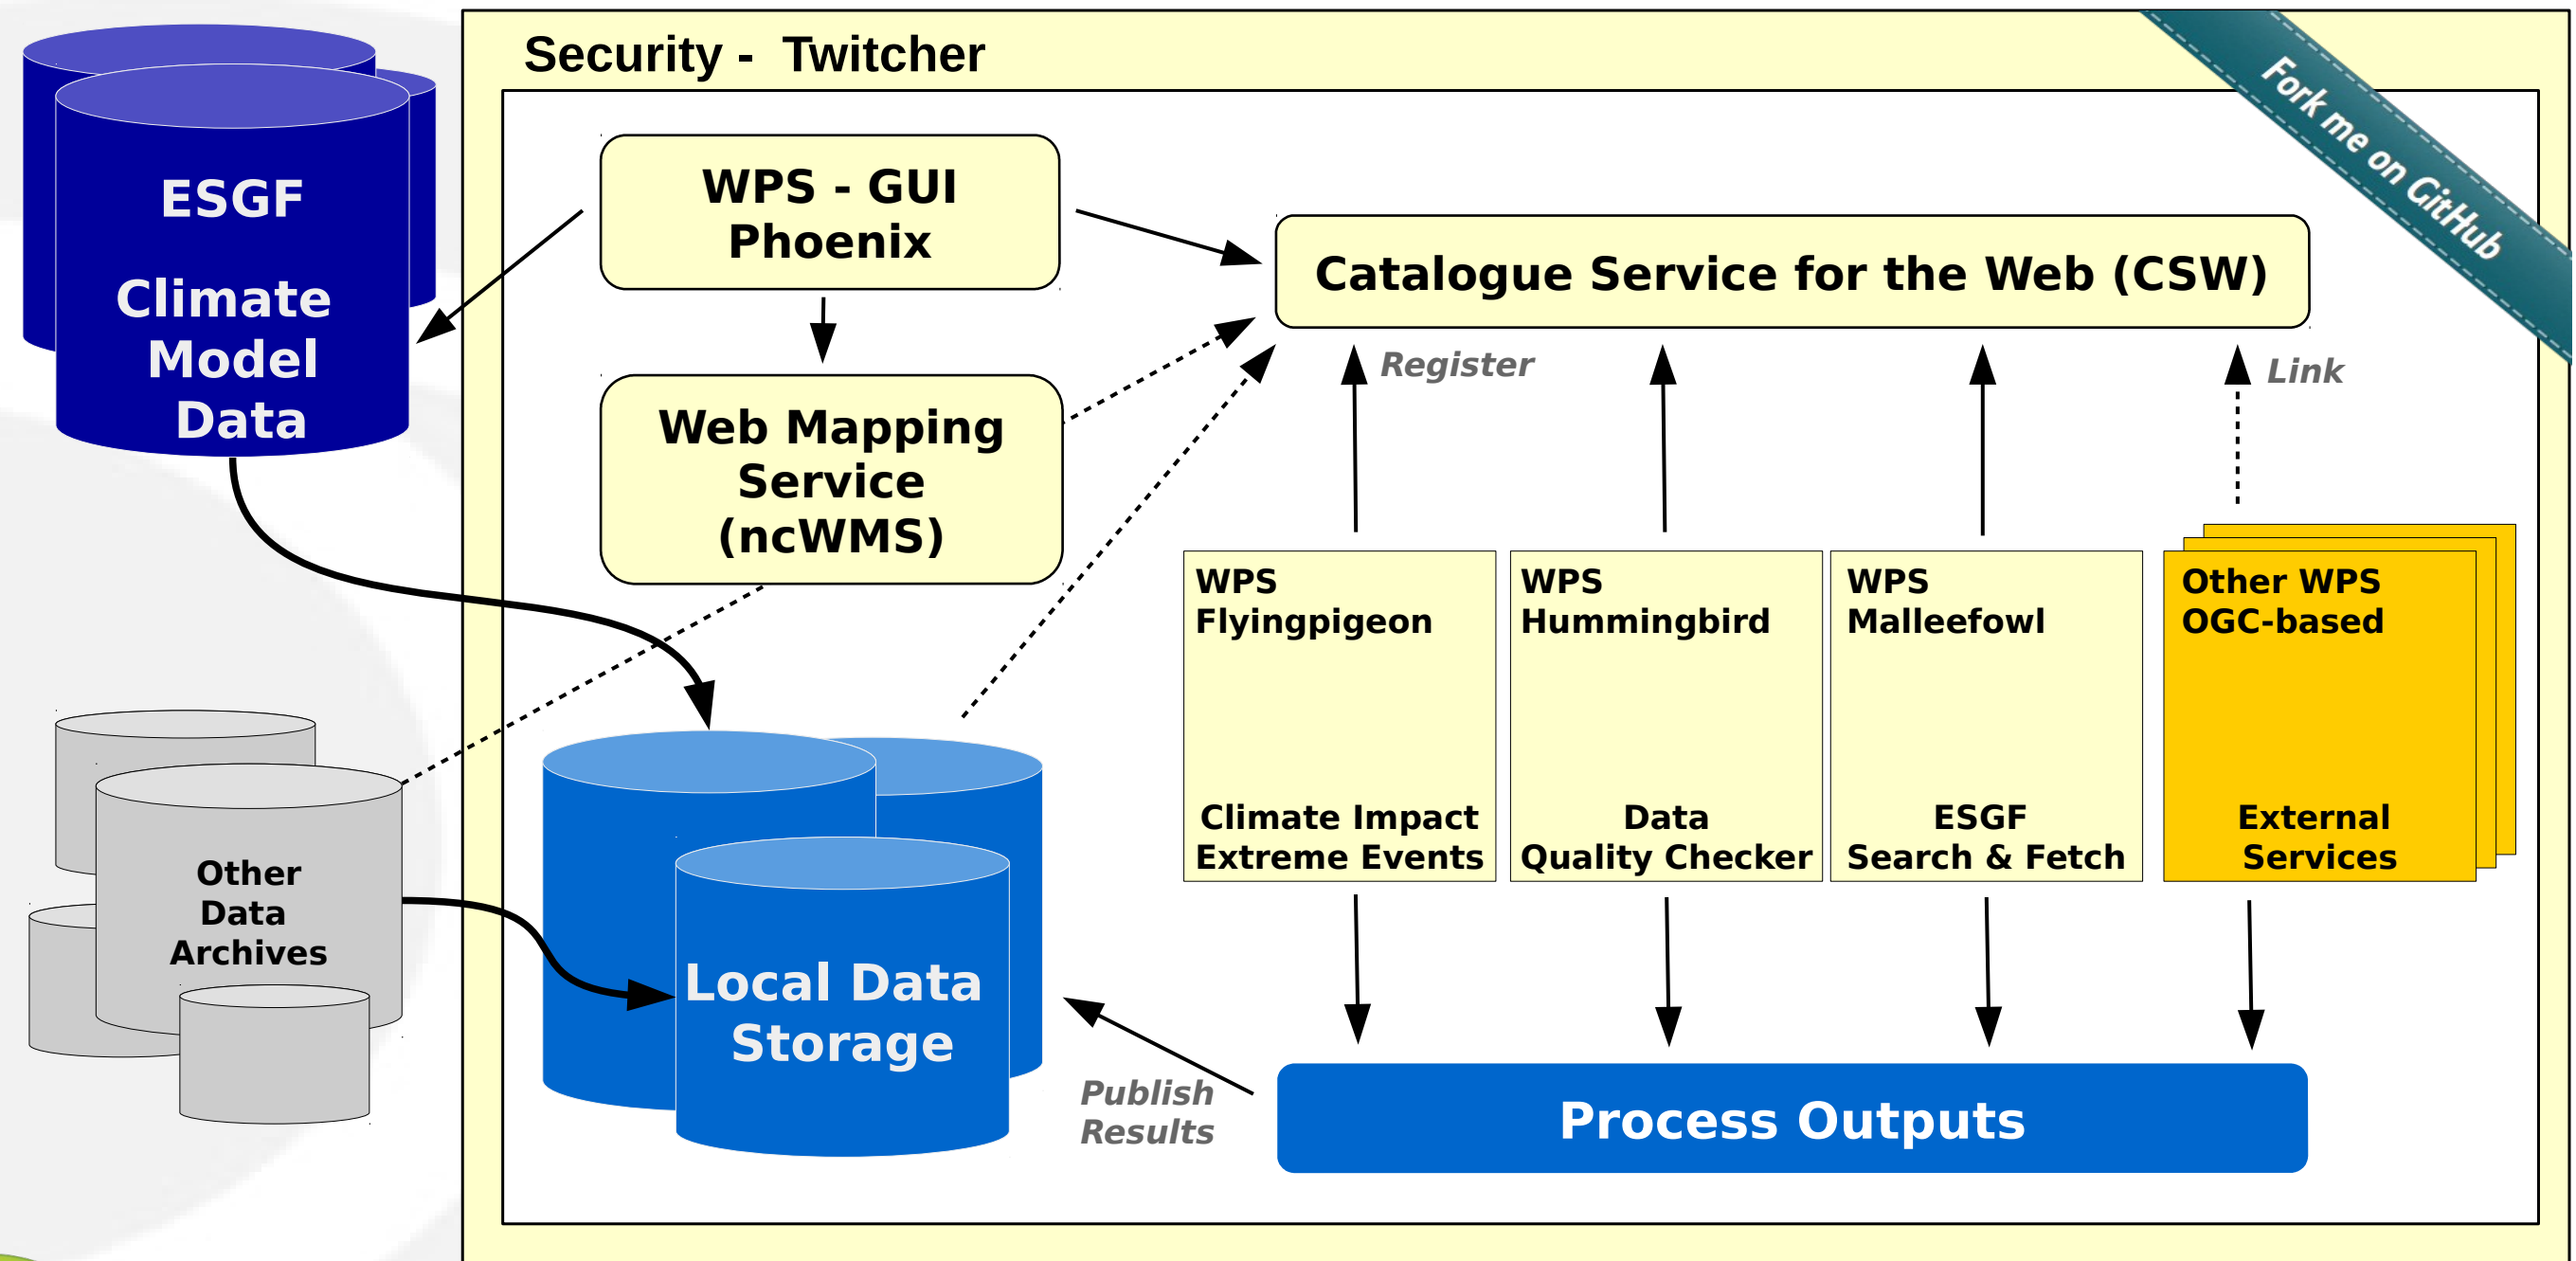

Web Processing Service

**Submit jobs on a Server
close to the data**

Server-Client Side

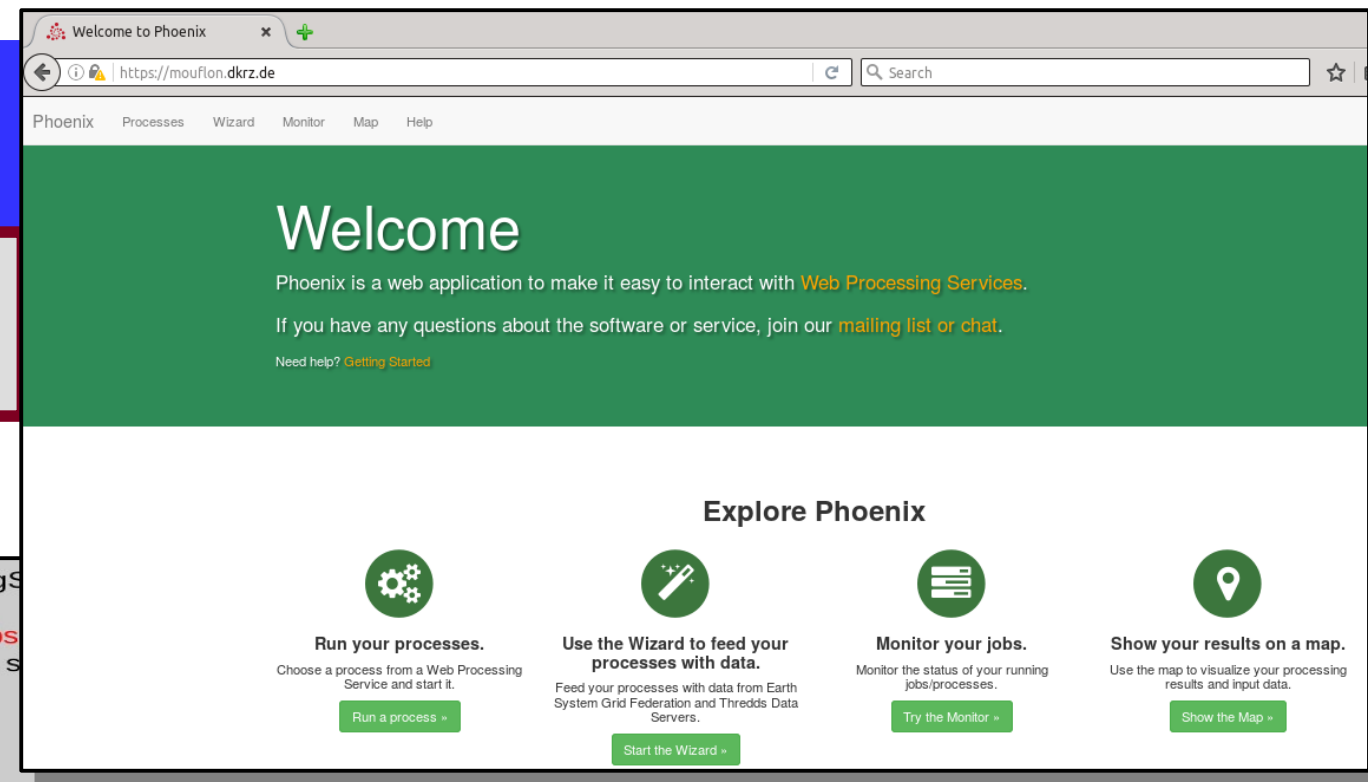

Client Side

Web Browser GUI

Authentication with OAuth or OpenID

Script language Terminal Call

Token authentication

```
[nhempel@lsce3199 ~]$ export WPS_SERVICE=https://mouflon.dkrz.de
```

```
[nhempel@lsce3199 ~]$ birdy -h
```

```
usage: birdy [<options>] <command> [<args>]
```

Flyingpigeon: Processes for climate data, indices and extrem events

optional arguments:

```
-h, --help          show this help message and exit
--debug            enable debug mode
```

command:

List of available commands (wps processes)

```
{visualisation,sdm,segetalflora,indices_single,subset_countries,eobs_to_cordex,ensembleRobustness}
Run "birdy <command> -h" to get additional help.
```

visualisation	Visualisation of netcdf files:
sdm	Species distribution model:
segetalflora	Segetal Flora:

indices_single	Calculation of climate indice (single variable):
----------------	--

subset_countries	Subset netCDF files:
------------------	----------------------

eobs_to_cordex	EOBS to CORDEX:
----------------	-----------------

ensembleRobustness	Calculation of the robustness of an ensemble:
--------------------	---

analogs	Days with analog pressure pattern:
---------	------------------------------------

fetch	Download Resources:
-------	---------------------

```
from owslib.wps import WebProcessingService
```

```
wps = WebProcessingService(url="https://mouflon.dkrz.de",
                           verbose=False, session_token="token")
```

```
execute = wps.execute(
    identifier="niceprocess",
    inputs=[
        ("parameter_1", "argument"),
        ("parameter_2", "42"),
        # ("parameter_3", "0.987"), # use the default value
        ("file_identifier", "https://thredds/fileServer1/test/file1.nc"),
        ("file_identifier", "https://thredds/fileServer1/test/file2.nc"),
        ("file_identifier", "https://thredds/fileServer2/test/file3.nc"),
    ],
    output=[("output", True)])
```

```
# time for a coffee
```

```
for o in execute.processOutputs:
    print o.reference
```

```
https://mouflon.dkrz.de:8090/wpsoutputs/flyingpigeon/output_graphic-697dee76-d722-93ae-9789bf75cf44.png
https://mouflon.dkrz.de:8090/wpsoutputs/flyingpigeon/output_netCDF-697dee76-d722-93ae-9789bf75cf44.nc
https://mouflon.dkrz.de:8090/wpsoutputs/flyingpigeon/output_text-697dee76-d722-93ae-9789bf75cf44.txt
```

Just testing a nice script to visualise some variables

Species distribution model

Species biodiversity of segetal flora. Input files: variable:tas , domain: EUR-11 or EUR-44

This process calculates climate indices based on one single variable.

This process returns only the given polygon from input netCDF files.

downloads EOBS data in adapted CORDEX format

Calculates the robustness as the ratio of noise to

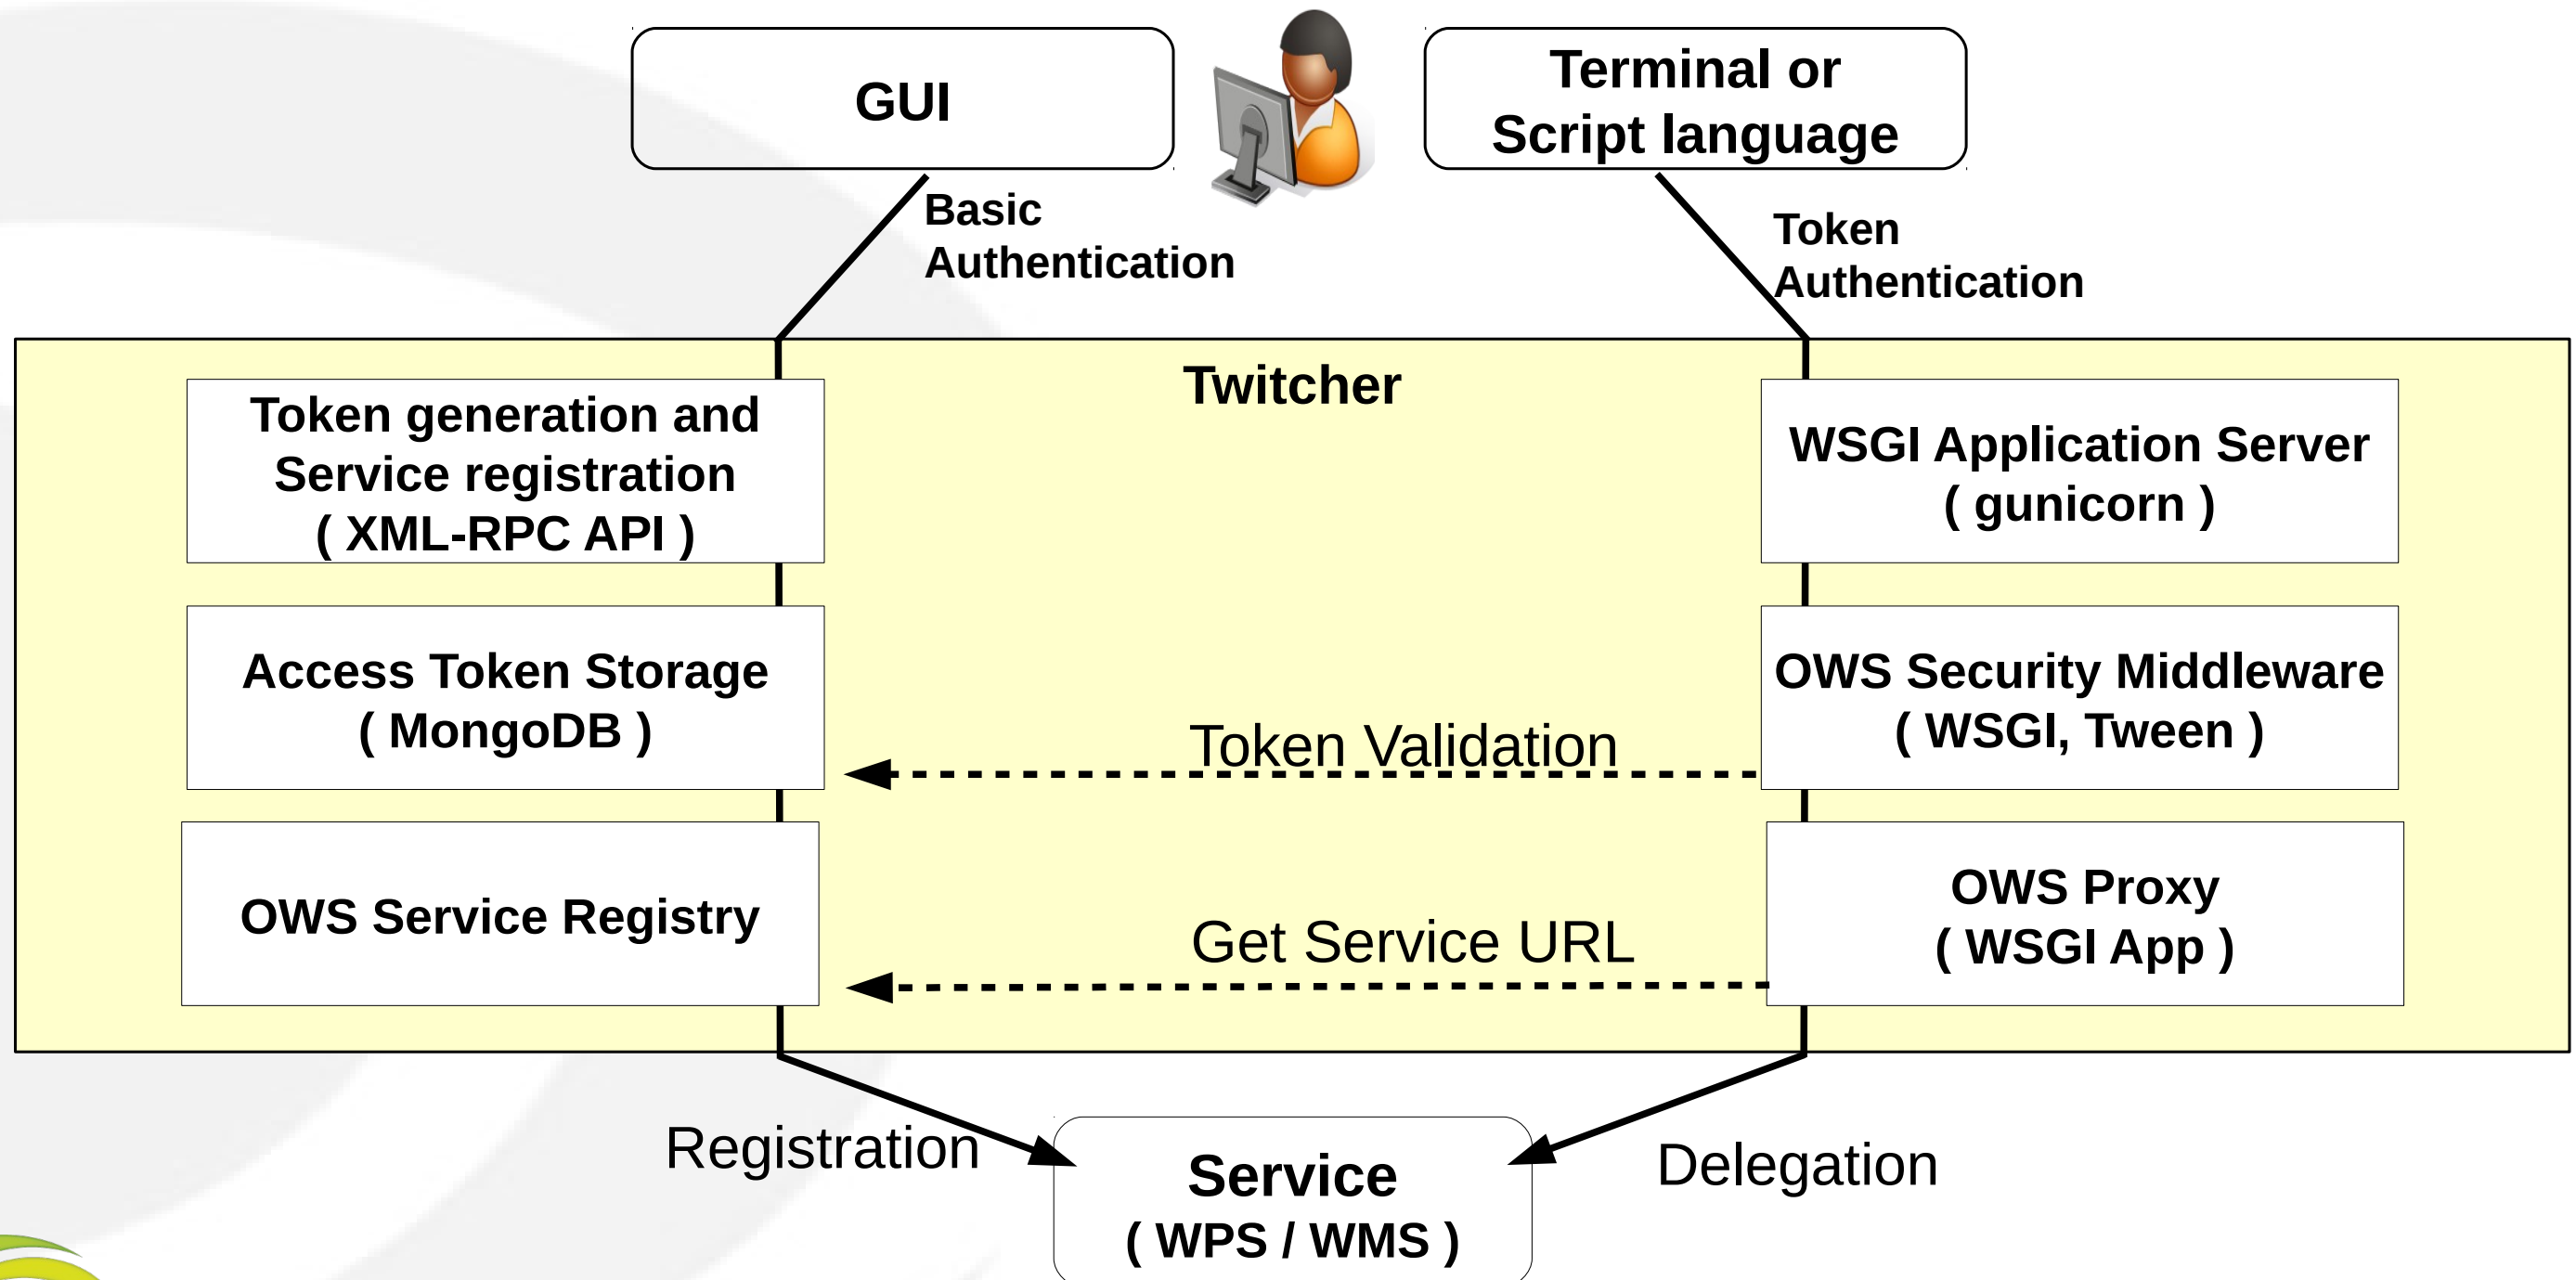

signal in an ensemble of timeseries

Search for day with analog pressure pattern

This process downloads resources (limited to 50GB) to the local file system and returns a textfile with appropriate paths

Deployment with conda and buildout

Using conda package manager to setup an environment with all used software components (python, R, matplotlib, PyWPS, ...)

Using buildout to setup PyWPS with all services (supervisor, gunicorn, nginx) and configuration files.

To install a *Bird* just run :

```
$ git clone https://github.com/bird-house/flyingpigeon.git  
$ cd flyingpigeon  
$ make install  
$ make start
```

<http://conda.pydata.org/docs/>

<http://www.buildout.org/en/latest/>

Solr Index for Data (bird-feeder)

Run bird-feeder to create Solr search Index for Thredds Data Catalogs and local data

Hummingbird – quality checks for netCDF Data (technical)

NetCDF Metadata - Retrieve Metadata of NetCDF File

CF Checker by NCAS Computational Modelling Services (NCAS-CMS) - The NetCDF Climate Forecast Conventions compliance checker. This process allows you to run the compliance checker to check that the contents of a NetCDF file comply with the Climate and Forecasts (CF) Metadata Convention. The CF-checker was developed at the Hadley Centre for Climate Prediction and Research, UK Met Office by Rosalyn Hatcher. This work was supported by PRISM (PRogramme for Integrated Earth System Modelling). Development and maintenance for the CF-checker has now been taken over by the NCAS Computational Modelling Services (NCAS-CMS). If you have suggestions for improvement then please contact Rosalyn Hatcher at NCAS-CMS (r.s.hatcher@reading.ac.uk).

CF Checker by DKRZ - The NetCDF Climate Forecast Conventions compliance checker by DKRZ. This process allows you to run the compliance checker to check that the contents of a NetCDF file comply with the Climate and Forecasts (CF) Metadata Convention. The CF Conformance checker applies to conventions 1.4 -1.7draft. Development and maintenance for the CF-checker is done by the German Climate Computing Centre (DKRZ). If you have suggestions for improvement then please contact Heinz-Dieter Hollweg at DKRZ (hollweg@dkrz.de).

Quality Assurance Checker by DKRZ - The Quality Assurance checker QA-DKRZ checks conformance of meta-data of climate simulations given in NetCDF format with conventions and rules of climate model projects. At present, checking of CF Conventions, CMIP5, and CORDEX is supported. Development and maintenance for the QA checker is done by the German Climate Computing Centre (DKRZ). If you have suggestions for improvement then please contact Heinz-Dieter Hollweg at DKRZ (hollweg@dkrz.de).

IOOS Compliance Checker - The IOOS Compliance Checker is a Python tool to check local/remote datasets against a variety of compliance standards. Each compliance standard is executed by a Check Suite, which functions similar to a Python standard Unit Test. A Check Suite runs one or more checks against a dataset, returning a list of Results which are then aggregated into a summary. Development and maintenance for the compliance checker is done by the Integrated Ocean Observing System (IOOS).

Flyingpigeon - - Climate Impact and extreme events

Subset continents - Returns only the selected polygon for each input dataset

Subset countries - Returns only the selected polygon for each input dataset

Subset Points - Extract Timeseries for specified coordinates from gridded datasets

Climate indices -- Simple - Climate indices based on one single input variable.

Climate indices -- Percentile - Climate indices based on one single input variable and the percentile of a reference period.

Weather Regimes -- Reanalyses data - Weather Regimes based on pressure patterns, fetching selected Reanalyses Datasets

Weather Regimes -- Climate model data - Weather Regimes based on pressure patterns, fetching selected Reanalyses Datasets

Weather Regimes -- Projection of Weather Regimes - Weather Regimes detection based on trained reference statistics

Analogs -- Detection - Search for days with analog pressure pattern

Analogs -- Viewer - Visualisation of text output of analogue process

Segetal Flora - Species biodiversity of segetal flora. Input files: variable:tas , domain: EUR-11 or EUR-44

SDM -- GBIF search - Species distribution model for tree species based on GBIF presens/absence data and climate indices

SDM -- csv table - Species distribution model for tree species based on GBIF presens/absence data and climate indices

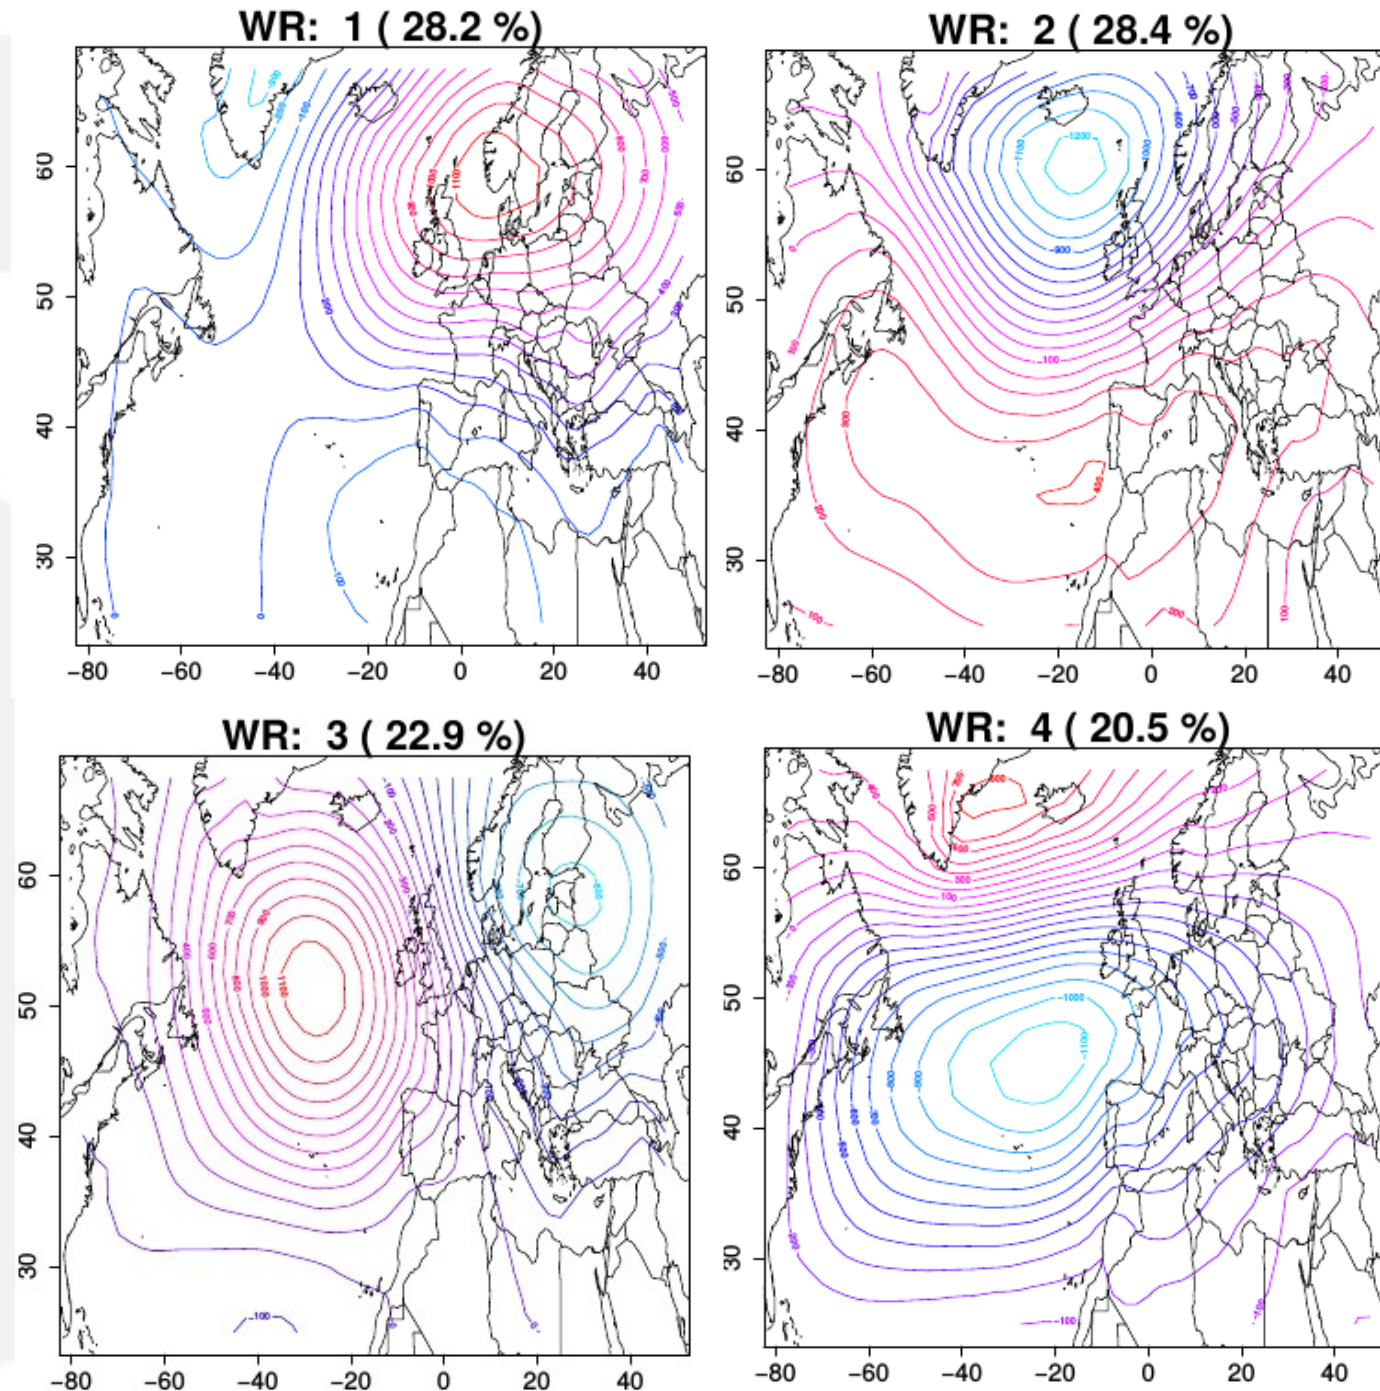

Timeseries plots - Plots of the filesmeans over time. Spagetti and uncertainty plot

Download Resources - This process downloads resources to the local file system of the birdhouse compute provider

More under development ;-)
